## **CLAIM LISTING**

## No amendments are being made.

1. (original) An ultrasound probe for connection with an imaging system, the probe comprising:

an ultrasound transducer;

a releasable connector electrically connected with the ultrasound transducer and releasably connectable with an ultrasound imaging system, the releasable connector having a plurality of electrical outputs for respective signals each representing one or more different elements; and

an analog-to-digital converter connected between the ultrasound transducer and the releasable connector.

- 2. (original) The probe of Claim 1 wherein the ultrasound transducer comprises a multidimensional array of elements.
- 3. (original) The probe of Claim 1 further comprising:
- a cable electrically connecting the ultrasound transducer to the analog-to-digital converter; and
- a housing connected with an end of the cable and at least partially around the releasable connector and the analog-to-digital converter, the housing spaced from the ultrasound transducer.
- 4. (original) The probe of Claim 1 wherein the transducer array comprises a plurality of transducer elements, the analog-to-digital converter electrically connected with at least a first element of the plurality of transducer elements;

further comprising a plurality of analog-to-digital converters, the plurality of analog-to-digital converters including the analog-to-digital converter electrically connected with the first element, the plurality of analog-to-digital converters electrically connected with different ones of the plurality of transducer elements.

02/08/2007 17:12 6509684517 SIEMENS CORP. IPD-W PAGE 03/10

5. (original) The probe of Claim 4 further comprising:

a plurality of cables electrically connecting the plurality of transducer elements to the respectively plurality of analog-to-digital converters, the plurality of cables being fewer than the plurality of transducer elements; and

a multiplexer electrically connected between the plurality of cables and the plurality of transducer elements.

- 6. (original) The probe of Claim 1 further comprising:
- a summer connected with the analog-to-digital converter, the summer operable to combine signals from at least two elements of the transducer array, the combined signal output on one of the plurality of electrical outputs as a signal representing one of the different elements.
- 7. (original) The probe of Claim 1 further comprising a partial beamformer operable to combine data from elements of the transducer array and output the combined data on respective ones of the plurality of electrical outputs.
- 8. (original) The probe of Claim 1 further comprising: a digital processor connected between the analog-to-digital converter and one of the plurality of electrical outputs.
- 9. (original) The probe of Claim 1 further comprising: a switch connected between the transducer array and the analog-to-digital converter, the switch operable to bypass analog signals to one of the plurality of electrical outputs.
- 10. (original) The probe of Claim 1 further comprising: a demultiplexer connected with the analog-to-digital converter; and a serializer connected with the demultiplexer and at least one of the plurality of electrical outputs.

- 11. (original) A system for communicating signals from a transducer for imaging, the system comprising:
  - a processing system comprising:

6509684517

- at least a part of a receive beamformer;
- a system housing; and
- a connector on the system housing, the connector electrically connectable with the receive beamformer; and
- a detachable transducer assembly comprising:
  - a transducer probe at least partially housing an array of elements;
  - a connector housing at least partially housing an analog-to-digital converter, the connector housing physically connectable and detachable from the connector on the system housing; and
  - at least one cable connecting the transducer probe with the connector housing.
- 12. (original) The system of Claim 11 wherein the transducer probe is a handheld probe.
- 13. (original) The system of Claim 11 wherein:

the transducer probe further houses a multiplexer connected with a plurality of the elements of the array, the multiplexer operable to multiplex signals from the plurality of elements to an output; and

the connector housing further housing a demultiplexer.

- 14. (original) The system of Claim 11 wherein the connector housing further houses a serializer connected with the analog-to-digital converter.
- 15. (original) The system of Claim 11 wherein the connector housing further houses a processor, the processor operable to compress digital data responsive to output by the analogto-digital converter.

16. (original) An ultrasound probe for connection with an imaging system, the probe comprising:

an ultrasound transducer;

a releasable connector electrically connected with the ultrasound transducer and releasably connectable with an ultrasound imaging system, the releasable connector having a plurality of electrical outputs for respective signals representing different elements; and

a processor connected between the ultrasound transducer and the releasable connector, the processor in a housing of the releasable connector and operable to compress signals from the ultrasound transducer.

- 17. (original) The probe of Claim 16 further comprising an analog-to-digital converter between the transducer and the processor, the processor comprising a digital processor.
- 18. (original) The probe of Claim 16 further comprising a cable between the housing and the ultrasound transducer.
- 19. (original) The probe of Claim 16 wherein the processor is operable to compress signals by partial beamforming.
- 20. (original) A method for communicating signals from a transducer array to an imaging system, the method comprising:
  - (a) releasably connecting a probe assembly to an imaging system;
  - (b) transducing acoustic energy into electrical signals:
  - (c) transmitting the electrical signals to an analog-to-digital converter;
- (d) converting the electrical signals into digital data within the probe assembly; and
- (e) passing the digital data from the probe assembly to at least a part of a beamformer of the imaging system.

- 21. (original) The method of Claim 20 wherein (c) comprises transmitting the electrical signals through a cable of the probe assembly, and wherein (d) comprises converting the electrical signals into digital data within a connector housing of the probe assembly.
- 22. (original) The method of Claim 20 further comprising:
  - (f) compressing the digital data prior to (e).
- 23. (original) The method of Claim 20 further comprising:
  - (f) time division multiplexing the electrical signals prior to (c); and
  - (g) demultiplexing the digital data after (d) and before (e).
- 24. (original) The probe of Claim 3 wherein transducer cables within the cable each have a constant length and same impedance.
